

International Development Aid

What We Do

International financing from Donors and International Financing Institutions (IFI) provide an important line for development and improvement of lower and middle-income economies. International Development Aid (IDA) can provide crucial support for infrastructure programmes, social and gender development, environment, sustainability, and climate change adaptation.

IDA work is designed to promote poverty reduction, foster economic growth, deliver sustainable infrastructure, and strengthen institutions and stability in developing countries.

ESC has a successful working history with international donors and IFIs going back to 2010 working with the UNDP and AusAID through their Indonesia Infrastructure Initiative (IndII) programme.

International Donors and IFIs have very exacting requirements for project and programme preparation and delivery built upon stringent requirements for transparency and oversight. Our team of experienced experts understand how to deliver projects and meet these expectations without compromising standards and tight delivery timelines.

Our Approach

ESC has a detailed understanding of the approach and standards required by International Donors and IFIs, and many of our team have experience working directly for these agencies. Our approach integrates a detailed knowledge and understanding of international standards and best practices, and how to apply these to national, developing country scenarios in a manner that is appropriate to host country laws and regulations, and takes into account local culture, customs and standards.

Our experts specialise in delivering Technical Assistance (TA) projects and programmes which are often large (multi-year, multi-million dollar), and highly complex, involving a diverse range of stakeholders from international funding agencies and host country governments to private sector, local communities and NGOs.

Our team's experience and expertise in TAs cover the full project cycle from preparation, pre-feasibility, and feasibility studies, through to detailed engineering design, project commissioning, project evaluation and due diligence. We specialise in maintaining the BIG picture view on all facets of the project; taking into account project and programme objectives and goals, meeting technical expectations while considering carefully stakeholders' priorities, concerns and interests.

Our Technical Capabilities

- Environmental & Social Development Programmes (In particular, Safeguards, Due Diligence, and Preparation of Standards and Guidelines)
- Institutional Capacity Building
- Natural Resources and Rural Development
 - Water Supply, Sanitation, Public Health;
 - Climate Change; Climate Adaption
 - Energy Security (Particularly Renewables);
